Chapter 1: Understanding Visual Design

1.1 Design Fundamentals

Design fundamentals are the essential building blocks that designers use to create visually appealing and effective compositions. These elements form the foundation of all visual communication, from traditional art to modern digital interfaces. By understanding and mastering these fundamentals, you'll be able to analyse designs around you and create your own impactful visual messages.

Let's dive deeper into five key design fundamentals, exploring their characteristics, examples in Indian context, and practical applications:

1.1.1 Line

A line is the most basic element of design, defined as a mark connecting two points. Lines can vary in length, width, direction, and curve.

Characteristics:

- Can be straight, curved, zigzag, or freeform
- Can be thick, thin, or varying in width
- Can be continuous, broken, or implied

Examples in Physical Context:

- The straight, vertical lines of the India Gate in New Delhi
- The dynamic, diagonal lines in the poses of Bharatanatyam dancers
- The delicate, intricate lines in Warli tribal art

Practical Applications:

- In graphic design: Using lines to separate sections in a newspaper layout
- In architecture: The strong vertical lines of Mumbai's skyscrapers to convey height and modernity
- In fashion: The patterns of lines in a Kanchipuram silk sari

- In UI design: Using lines to create tables or separators in a mobile app interface

1.1.2 Shape

Shape is a two-dimensional area enclosed by lines. Shapes can be geometric (regular, mathematically precise) or organic (irregular, freeform).

Characteristics:

- Can be closed (like a circle) or open (like a U-shape)
- Can be positive (the object) or negative (the space around the object)
- Can be symbolic (like a heart shape) or abstract

Examples in Physical Context:

- The perfect circular shape of a gol gappa (pani puri)
- The triangular shape of a samosa
- The organic, flowing shapes in alpana floor art of Bengal
- The geometric patterns in Islamic architecture, like at Qutub Minar

Practical Applications:

- In logo design: The simple, memorable shape of the Air India logo
- In product design: The distinctive shape of a Bajaj Chetak scooter
- In UI design: Using shapes for buttons or icons in a website
- In architecture: The unique shape of Lotus Temple in Delhi

1.1.3 Form

Form refers to three-dimensional shapes. It's what gives objects depth, volume, and mass.

Characteristics:

- Can be geometric (like a cube) or organic (like a human figure)
- Defined by height, width, and depth

- Can be enhanced by light and shadow

Examples in Physical Context:

- The spherical form of a cricket ball
- The conical form of a South Indian filter coffee dabara set
- The complex, organic form of a Nataraja bronze statue
- The cylindrical form of a tabla drum

Practical Applications:

- In product design: The ergonomic form of a modern smartphone
- In sculpture: The lifelike forms in the rock-cut temples of Ellora
- In architecture: The massive, imposing form of Chhatrapati Shivaji Terminus in Mumbai
- In UI design: Creating the illusion of 3D forms through shading and perspective in app icons

1.1.4 Texture

Texture refers to the surface quality of an object. In visual design, texture can be tactile (physical) or visual (implied).

Characteristics:

- Can be rough, smooth, soft, hard, glossy, or matte
- Can create depth and interest in a design
- Can evoke emotional responses (e.g., soft textures often feel comforting)

Examples in Physical Context:

- The rough texture of handmade khadi fabric
- The smooth, cool texture of marble at the Taj Mahal
- The visual texture in the brushstrokes of Mughal miniature paintings
- The varied textures in a traditional Indian thali meal

Practical Applications:

- In fashion design: Combining textures like silk, brocade, and embroidery in a lehenga
- In interior design: Using textured wallpapers to add depth to a room
- In graphic design: Adding subtle textures to backgrounds in a poster design
- In UI design: Using visual textures to create depth and hierarchy in a website layout

1.1.5 Colour

Colour is a powerful design element that can evoke emotions, create mood, symbolise ideas, and draw attention.

Characteristics:

- Defined by hue (the colour itself), value (lightness or darkness), and saturation (intensity)
- Can be warm (reds, oranges, yellows) or cool (blues, greens, purples)
- Can create harmony or contrast in a design

Examples in Physical Context:

- The vibrant colours of Holi powder
- The rich, deep colours of spices in a market
- The symbolic colours of the Indian flag (saffron, white, green)
- The colourful truck art seen on highways across India

Practical Applications:

- In branding: The recognizable blue colour of SBI (State Bank of India) logo
- In UI design: Using colour to highlight important buttons or information in an app
- In fashion: The traditional red colour of a bridal lehenga
- In data visualisation: Using colours to represent different categories in a chart or infographic

How These Elements Work Together

In practice, designers rarely use these elements in isolation. They combine them to create complex, engaging designs. For example:

1. A Bollywood movie poster might use:
 - Bold, dynamic lines to create excitement
 - Recognizable shapes of the actors' silhouettes
 - The form of 3D text for the movie title
 - Visual texture in the background to add depth
 - Vibrant colours to attract attention and set the mood
2. The design of the Aadhaar card combines:
 - Lines to separate different sections of information
 - Shapes for the logo and other graphic elements
 - The form of the embedded chip
 - Subtle textures in the background for security features
 - A specific colour scheme that's easily recognizable
3. A popular Indian e-commerce app might use:
 - Lines to create a grid layout
 - Shapes for buttons and product thumbnails
 - The illusion of form in 3D-style icons
 - Visual textures to differentiate between sections
 - A carefully chosen colour scheme to guide users and highlight important elements

By understanding these fundamentals, you can start to analyse the designs you encounter every day. Why does a particular advertisement catch your eye? How does the layout of your textbook make information easy to understand? How do the design elements of your favourite app make it enjoyable to use?

As you progress in your studies, you'll learn how to intentionally use these elements to create your own effective designs. Remember, good design isn't just about aesthetics – it's about solving problems and communicating messages effectively. Whether you're creating a presentation for a school project, designing a poster for a cultural event, or dreaming up the next big app, these fundamentals will be your toolkit for success.

1.2 Principles of Design

The principles of design are essential guidelines that help designers create visually appealing and effective compositions. These principles apply to various forms of design, from graphic design to architecture, and even in everyday objects around us. By understanding and applying these principles, we can create designs that are not only beautiful but also functional and meaningful.

1.2.1 Unity

Unity, also known as harmony, is about creating a sense of wholeness in a design. All elements should work together to convey a single, cohesive message or theme.

Examples:

- Mehndi Designs: Notice how the intricate patterns in mehndi designs flow together, creating a unified look across the hand or foot.
- School Uniform: Your school uniform creates unity among students, making everyone feel part of the same community.
- Taj Mahal: The symmetry and consistent use of white marble throughout the Taj Mahal create a sense of unity in its architecture.
- Application: In poster design, using a consistent colour scheme and style for all elements helps achieve unity.

1.2.2 Balance

Balance is about distributing the visual weight of elements in a composition. It can be symmetrical (evenly distributed) or asymmetrical (unevenly distributed but still feels balanced).

Examples:

- Traditional Indian Thali: The arrangement of different dishes around the plate creates a balanced composition.
- Peacock Feathers: The symmetrical pattern of a peacock's tail feathers is a perfect example of balance in nature.
- Yoga Poses: Many yoga asanas, like Vrikshasana (Tree Pose), demonstrate physical balance.

Application: In web page design, balancing text content on one side with images on the other creates visual stability.

1.2.3 Hierarchy

Hierarchy guides the viewer's eye to the most important elements first, then to less important ones.

Examples:

- Indian Railway Station Boards: The station name is typically the largest text, followed by smaller text for platform numbers and other information.
- Textbook Layout: Chapter titles are larger than section headings, which are larger than body text.
- Indian Rupee Notes: The denomination (500, 2000) is the most prominent, followed by other details in smaller sizes.

Application: In app design, the main action button (like "Book Now" or "Buy") is often larger and more prominent than other elements.

1.2.4 Contrast

Contrast creates visual interest and helps distinguish between different elements.

Examples:

- Traffic Signals: The use of bright colours (red, yellow, green) against a dark background creates strong contrast for visibility.
- Chessboard: The alternating black and white squares create a high-contrast pattern.
- Kolam Designs: White rice flour patterns on dark earth create beautiful contrast in these South Indian art forms.

Application: Using light text on a dark background (or vice versa in presentations can make information stand out.

1.2.5 Emphasis

Emphasis draws attention to a specific element in the design, making it a focal point.

Examples:

- Rangoli Designs: Often, the centre of a rangoli is more elaborate or colourful, emphasising it as the focal point.
- Movie Posters: The main actor or a key scene is typically emphasised by size or positioning.
- The Red Fort: The red sandstone walls stand out against the surroundings, emphasising the structure.

Application: In advertisement design, the product being sold is often emphasised through size, colour, or positioning.

1.2.6 Scale

Scale refers to the size relationship between elements in a design or between the design and its context.

Examples:

- **Monuments and Surroundings:** The scale of the India Gate compared to people standing near it creates a sense of grandeur.
- **Banyan Tree:** The massive scale of a banyan tree compared to its leaves illustrates the principle of scale in nature.
- **Miniature Paintings:** Traditional Indian miniature paintings play with scale by depicting detailed scenes in a small format.

Application: In logo design, ensuring the logo is legible at both large (billboard) and small (business card) scales is crucial.

1.2.7 Repetition

Repetition involves reusing design elements to create rhythm, consistency, and unity.

Examples:

- Tabla Rhythms: The repeated patterns in tabla beats create musical rhythm.
- Jali Designs: The repeated geometric patterns in Jali (latticed screen) designs in Indian architecture.
- Madhubani Paintings: These traditional paintings often use repeated motifs and patterns.

Application: In branding, repeating the same colour scheme and logo across all materials creates a consistent brand identity.

By understanding and applying these principles, you can analyse designs around you - from the layout of your favourite magazine to the architecture of historical monuments. As you progress in your studies, you'll learn to use these principles to create your own effective and appealing designs, whether it's for a school project poster or a digital presentation.

1.3 Visual Communication

Visual communication is the art and science of using visual elements to convey messages, ideas, and information. In our increasingly visual world, from smartphone apps to street advertisements, understanding visual communication is crucial. It allows us to not only comprehend the messages around us but also to create our own effective visual content.

Let's delve deeper into the key elements of visual communication, exploring their characteristics, examples in Indian contexts, and practical applications:

1.3.1 Layout

Layout is the arrangement of visual elements in a design. It's like the blueprint of visual communication, determining how information is organised and presented.

Characteristics:

- Guides the viewer's eye through the information
- Creates a visual flow and balance
- Helps organise information in order of importance

Examples in Indian Context:

- The layout of a traditional Hindu temple, with the garbhagriha (inner sanctum) at the centre
- The arrangement of sections in an Indian newspaper like 'The Times of India'
- The layout of a typical NCERT textbook page, with main text, sidebars, and images

Practical Applications:

- Designing a poster for your school's annual day celebration
- Creating a presentation slide for a class project
- Arranging elements on an Instagram post about your favourite cricket team

Exercise: Look at the front page of a newspaper. Notice how the most important news is usually at the top or in the centre, with larger headlines. This is a layout at work!

1.3.2 Colour

Colour is a powerful tool in visual communication. It can evoke emotions, create associations, and highlight important information.

Characteristics:

- Can create mood and atmosphere
- Helps in categorising and organising information
- Has cultural and symbolic meanings

Examples in Indian Context:

- The use of red in Indian weddings, symbolising love and prosperity
- The saffron, white, and green of the Indian flag, each with its own meaning
- The vibrant colours used in truck art across Indian highways

Practical Applications:

- Designing a logo for your school's tech club (using blue to represent technology)
- Creating a chart to present data in your science project
- Choosing colours for your class's farewell party decorations

Exercise: Think about popular Indian brands like Amul or Tata. What colours do they use in their logos and why?

1.3.3 Typography

Typography is the art of arranging text to make it legible, readable, and visually appealing.

Characteristics:

- Includes font choice, size, spacing, and arrangement

- Can convey tone and personality (e.g., formal, playful, modern)
- Affects readability and emphasis of information

Examples in Indian Context:

- The distinctive Devanagari script used in Hindi newspapers
- The mix of English and regional language typography in bilingual street signs
- The ornate typography often seen in Indian wedding invitations

Practical Applications:

- Designing a poster for a school debate competition
- Creating titles and subtitles for your class magazine
- Making handmade cards for Diwali with beautiful lettering

Exercise: Look at the packaging of your favourite Indian snack. How does the typography of the brand name differ from the ingredient list? Why do you think this is?

1.3.4 Hierarchy

Visual hierarchy is about organising design elements to show their order of importance.

Characteristics:

- Guides the viewer's attention in a specific order
- Uses size, colour, contrast, and positioning to show importance
- Helps in creating a clear and organised message

Examples in Indian Context:

- The hierarchical arrangement of deities in a Hindu temple mural
- The visual hierarchy in an Aadhaar card, with the photo and number most prominent
- The arrangement of dishes in a traditional Indian thali

Practical Applications:

- Designing a flowchart for a history timeline project
- Creating a menu for a school canteen
- Organising information on a poster about water conservation

Exercise: Examine a railway ticket. What information stands out the most? How is less important information presented?

1.3.5 Composition

Composition refers to how all elements in a design work together to create a cohesive whole.

Characteristics:

- Creates balance and harmony in the design
- Uses principles like the rule of thirds, symmetry, or golden ratio
- Affects how the viewer perceives and interacts with the design

Examples in Indian Context:

- The symmetrical composition of the Taj Mahal
- The complex yet balanced compositions in Madhubani paintings
- The composition of elements in a typical rangoli design

Practical Applications:

- Taking a photograph for your school's photography club
- Arranging elements on your science fair project display board
- Designing the layout for your class yearbook page

Exercise: Look at an Indian rupee note. Notice how the various elements (numbers, text, images) are arranged to create a balanced composition.

1.4 Design Thinking

Design Thinking is a creative problem-solving approach that puts the user at the centre of the process. It's a way of thinking that can help you come up with innovative solutions to complex problems. Whether you're designing a new product, improving a service, or solving a community issue, Design Thinking can guide you through the process.

Let's explore the five "spaces" or stages of Design Thinking, with examples relevant to your life in India:

1.4.1 Empathise

In this stage, you try to understand the problem from the user's perspective. You observe, engage, and empathise with people to understand their experiences and motivations.

Example: Imagine you want to improve the lunch system in your school canteen. You would start by observing students during lunch, talking to them about their experiences, and even trying the canteen food yourself to truly understand the issues.

1.4.2 Define

Here, you clearly state the problem based on the insights gained from the Empathise stage. You're defining the core problem you want to solve.

Example: After your research, you might define the problem as: "Students need a quicker way to get their lunch because the current system causes long queues, leaving them with little time to eat."

1.4.3 Ideate

This is the brainstorming stage. You generate a wide range of creative ideas for solving the defined problem. No idea is too wild at this stage!

Example: To solve the canteen problem, ideas might include: introducing a pre-ordering system via a mobile app, setting up multiple serving stations, or creating a 'grab-and-go' section for quick meals.

1.4.3 Prototype

In this stage, you create scaled-down versions of your product or solution. The goal is to have something tangible to test your ideas.

Example: For the canteen solution, you might create a basic version of a lunch pre-ordering app using paper sketches or a simple digital mock-up.

1.4.5 Test

Finally, you test your prototypes with actual users and gather feedback. This stage often leads back to earlier stages as you use the feedback to refine your solution.

Example: You could have a group of students try out your paper prototype of the pre-ordering system and give feedback. Based on their input, you might need to go back to the Ideate or Prototype stage to improve your solution.

1.5 Real-World Application: Designing a Water Conservation Campaign

Let's see how Design Thinking could be applied to a real-world problem in India:

1.5.1 Empathise

You observe water usage in your community and talk to people about their water habits. You discover that many people are unaware of how much water they waste daily.

1.5.2 Define

You define the problem: "People in our community need an engaging way to learn about water conservation and its importance."

1.5.3 Ideate

You brainstorm ideas like creating a mobile game about water conservation, organising a street play, or starting a social media challenge.

1.5.4 Prototype

You decide to prototype the mobile game idea. You create a simple storyboard of how the game would work.

1.5.5 Test

You show your storyboard to classmates and gather their feedback. You learn that while they like the game idea, they suggest adding real-world challenges that players can complete to save water in their daily lives.

This process might repeat several times as you refine your idea based on user feedback.

Remember, Design Thinking is not a linear process. You might move back and forth between these stages as you gain new insights and refine your ideas.

By practising Design Thinking, you'll develop skills in empathy, creativity, and problem-solving that will be valuable in many aspects of your life and future career. Start by observing problems around you in school or your community.

1.6 Real-World Applications of Design Thinking

Let's explore how Design Thinking can be applied to various scenarios relevant to your life in India. Each example will walk through the five stages: Empathise, Define, Ideate, Prototype, and Test.

1.6.1. Reducing Plastic Waste in School

- Empathise: You observe that a lot of plastic waste is generated in your school, especially from disposable water bottles and food packaging.
- Define: The problem is: "Students need an easy and appealing way to reduce their plastic waste at school."
- Ideate: Brainstormed ideas include introducing reusable water bottles with the school logo, setting up water refill stations, organising a 'plastic-free lunch' competition, and creating an awareness campaign.
- Prototype: You create a sample reusable water bottle design and a mock-up of a water refill station placement map for the school.
- Test: You present your prototypes to a group of students and teachers, gathering feedback on the designs and potential challenges in implementation.

1.6.2 Improving Road Safety Near Your School

- Empathise: You notice that the road crossing near your school is dangerous for students due to heavy traffic and lack of proper signals.
- Define: The problem is: "Students need a safer way to cross the busy road near the school."
- Ideate: Ideas include designing a student-led traffic management system, creating a mobile app that alerts drivers about school zones, proposing a new pedestrian bridge, or organising a 'safe road crossing' awareness campaign.

- **Prototype:** You create a detailed plan for a student traffic warden system, including duty rosters and simple hand signals.
- **Test:** You conduct a small-scale trial of your traffic warden system during morning school hours and collect feedback from students, teachers, and local traffic police.

1.6.3 Enhancing Online Learning Experience

- **Empathise:** Due to poor network, you and your classmates struggled with online classes leading to lack of interaction, and difficulty in understanding certain topics across various subjects.
- **Define:** The problem is: "Students need a more engaging and effective online learning experience that addresses connectivity issues and promotes better understanding."
- **Ideate:** Ideas include developing a low-bandwidth friendly learning app, creating interactive virtual labs for science subjects, designing a peer-to-peer online tutoring system, or proposing a hybrid learning model.
- **Prototype:** You create a basic wireframe of a learning app that includes features like offline access to materials, virtual study groups, and interactive quizzes.
- **Test:** You share your app wireframe with classmates and teachers, collecting feedback on its features and usability.

1.6.4 Promoting Traditional Indian Games

- **Empathise:** You realise that many childhood games are being forgotten as more kids spend time on digital devices.
- **Define:** The problem is: "Young people need an exciting way to rediscover and engage in playing physical games."
- **Ideate:** Ideas include organising a games festival in school, creating board game versions of traditional games, developing a mobile app that provides incentive for physical games, or starting a YouTube channel showcasing these games.
- **Prototype:** You design a board game version of 'Lagori, Pithu' with graphics and simplified rules.
- **Test:** You invite a group of friends to play your prototype board game and gather their opinions on the gameplay and their interest in other traditional games.

1.6.5 Reducing Food Waste in Your Community

- Empathise: You notice that a lot of excess food from weddings and other events in your community goes to waste.
- Define: The problem is: "The community needs an efficient system to redistribute excess food from events to those in need."
- Ideate: Ideas include creating a food donation app connecting event organisers with local shelters, setting up locality fridges, organising a volunteer network for food collection and distribution, or starting an awareness campaign about food waste.
- Prototype: You create a basic version of a food donation app using an app prototyping tool, showing how event organisers can post about excess food and how local shelters can claim it.
- Test: You present your app prototype to some local event organisers and shelter representatives, gathering feedback on its usability and potential challenges.

Remember, these are just starting points. In each case, you might need to cycle back through the Design Thinking stages multiple times, refining your solution based on the feedback and insights you gather. The key is to remain user-focused, creative, and open to iteration throughout the process.

By applying Design Thinking to these real-world problems, you're not just finding solutions – you're also developing crucial skills in empathy, critical thinking, creativity, and communication. These skills will be valuable in your future studies and career, regardless of the field you choose to pursue.

1.7 Revisiting Visual Design: A Comprehensive Comparison

In the world of design, there are several key concepts that work together to create effective and meaningful designs. Let's break down four of these concepts: Design Thinking, Design Principles, Visual Communication, and Design Fundamentals.

1.8 Comparison Table

Concept	What is it?	Role in Design	Example in Indian Context
Design Fundamentals	Basic elements of design	The building blocks	Colours in a Madhubani painting
Design Principles	Guidelines for using fundamentals	The rules for effective design	Symmetry in Taj Mahal architecture
Visual Communication	Practice Conveying messages visually	The strategy for effective communication	Layout of information on an Aadhaar card
Design Thinking	Problem-solving approach	The process for innovative solutions	Designing a more efficient water distribution system for a village

1.9 Remember:

Understanding the four concepts and how they work together is crucial for creating effective designs:

- Design Fundamentals provide the basic elements you work with.
- Design Principles guide you in using these elements effectively.
- Visual Communication helps you use these elements and principles to convey your message.
- Design Thinking ensures that your design solves real problems for real people.

As you progress in your studies and perhaps consider a career in design, keep in mind that mastering these concepts will enable you to create designs that are not only visually appealing but also meaningful, effective, and user-centred.

1.10 Basics of Prototyping

Imagine you're building a sand castle on the beach. Before you create your masterpiece, you might make a small, simple version to test your ideas. That's essentially what prototyping is in the world of design!

1.10.1 What is Prototyping?

Prototyping is the process of creating a basic, working model of a product or service. In UI (User Interface) design, it's like making a 'rough draft' of an app or website that you can interact with. This allows designers to test their ideas and improve them before creating the final version.

1.10.2 Key Points About Prototyping

- **Simplified Representation:** A prototype is a simplified version of the final product. It's like a 'sneak peek' of what the final design might look like and how it might work.
- **Interactive Testing:** Prototypes allow you to test how users interact with your design. It's like letting your friends try out your sand castle design before you build the big one!
- **Feedback Collection:** By showing prototypes to users, designers can gather valuable feedback. This is like asking your friends what they think of your sand castle design.
- **Iterative Improvement:** Based on feedback, designers can quickly make changes and improvements. This process of 'make, test, improve' can happen many times before the final design is created.
- **Range of Fidelity:** Prototypes can be very simple (low-fidelity) or quite detailed (high-fidelity). We'll explore this more later!

- User-Centred Design: Prototyping helps ensure the final product meets user needs and is easy to use. It's all about creating designs that people will love to use.
- Early Stage Process: Prototyping happens early in the design process, before any final coding or development begins.

1.10.3 Why is Prototyping Important?

- Saves Time and Resources: It's easier and cheaper to make changes to a prototype than a finished product.
- Improves User Experience: By testing with users early, you can create designs that people find easy and enjoyable to use.
- Facilitates Communication: Prototypes help designers explain their ideas to team members, clients, or teachers more effectively than just describing them.
- Encourages Innovation: The quick, iterative nature of prototyping allows designers to try out creative ideas without big risks.

1.11 Task

Create Your Own Low-Fidelity Prototype!

Try this: Think of an app that would make your school life easier. Maybe it's for managing homework, finding study partners, or organising school events. On a piece of paper, sketch out 3-4 screens of this app. Show it to a friend or family member and ask for their feedback. This is your first step into the world of prototyping!

Remember, prototyping is all about trying out ideas quickly and improving them based on feedback. It's a crucial skill not just in UI/UX design, but in many areas of life where you need to turn ideas into reality. So start prototyping - you might just create the next big app that everyone in India uses!

1.12 Assessment

Read the Following MCQs and Tick the Correct Answer

1. Which of the following is NOT one of the five key design fundamentals discussed?

- ☐ Line
- ☐ Shape
- ☐ Texture
- ☐ Perspective

2. In the context of design, what does 'form' refer to?

- ☐ Two-dimensional shapes
- ☐ Three-dimensional shapes
- ☐ The outline of an object
- ☐ The space between objects

3. Which design principle is about distributing the visual weight of elements in a composition?

- ☐ Unity
- ☐ Balance
- ☐ Hierarchy
- ☐ Contrast

4. What is the first stage in the Design Thinking process?

- ☐ Define
- ☐ Ideate
- ☐ Empathise
- ☐ Prototype

5. Which of the following is an example of visual communication in an Indian context?

- ☐ The layout of a traditional Hindu temple
- ☐ The arrangement of dishes in a thali
- ☐ The typography on an Aadhaar card
- ☐ All of the above

6. What does the 'Ideate' stage in Design Thinking involve?

- ☐ Understanding the user's perspective
- ☐ Creating scaled-down versions of the solution
- ☐ Generating a wide range of creative ideas
- ☐ Testing the prototype with users

7. Which design fundamental is described as the surface quality of an object?

- ☐ Form
- ☐ Shape
- ☐ Texture
